Compiler Construction

Lab Practical Exam #1

Starting with the demonstration arithmetic expression parser from lecture, extend the grammar to include the "%" (modulus) operator, which has the same level of precedence as multiply and divide operators. Add modulus to the grammar in LP1Parser.jj, add an Absyn class to represent modulus expressions, and modify the Interpreter.java class to correctly execute modulus expressions.

Once you have executed the "`lpstart`" script, run "`make`" to compile your Interpreter, "`java Interpreter testfile`" to execute your Interpreter, and "`make test`" to diff your Interpreter against the expected result. Execute "`lpturnin`" to submit your code.

Submit early and often; no late submissions will be accepted.
